

GREAT WHITE KAOLIN PROJECT

MINE SITE PLAN

Mine form including contrasting and reflective aspects will be visually softened during construction and operation.

Andromeda plans to develop the Project in two stages. Stage One will include:

- an access road
- soil, overburden and run-of-mine (ROM) stockpiles
- several large sheds and workshops
- offices and parking area.

Construction of Stage One is expected to take up to 3 months.

Overburden from mining activity will be used for construction and maintenance of access roads, to provide visual barriers and wind breaks and backfill for the rehabilitation of mined areas.

Stage Two will include a processing plant to allow on-site wet processing, along with further workshops, gas storage and power generators.
